Given the availability of GPCR crystal structures in particular, the approach
Kinetic evidence for intermediate conformational states.
Although it is tough to find exact information about the structure there are a few known traits of the proteins. It is based on FRET and uses optical microspectroscopy technology in order to probe the structure of dynamic protein complexes in living cells [].
Although the cysteine-rich region is highly conserved in the frizzled receptor sequence-based techniques can be used to create models of monomers, dimers and oligomers of GPCRs and even identify dimer interfaces of GPCRs [].
